Name of the Guide		Dr. N. Sunanda	

Abstract

RetailIQ is a full-cycle e-commerce analytics project that focuses on understanding customer behaviour and sales performance using retail transaction data. The main aim of the project is to convert raw e-commerce data into useful information that can help in understanding how customers purchase products and how the business is performing. The dataset is analysed to identify important patterns related to sales, customers, products, and revenue.

The project includes different stages such as data cleaning, preprocessing, exploratory data analysis, and visualization. The data is studied to find the products that perform well, customer purchasing patterns, sales trends, and other factors that affect overall business performance. Different charts and statistical analysis techniques are used to make these patterns easier to understand and compare.

An interactive dashboard is also developed to present the important findings in a simple and user-friendly manner. The dashboard allows users to view sales trends, customer segments, product performance, revenue-related information, and other key metrics. Overall, RetailIQ demonstrates how data analytics can be used in the e-commerce sector to understand customers, monitor sales performance, identify useful business patterns, and support better data-driven decision-making.
